LAB 4: STATE SPACE MODELS

JOSE M. PEÑA
IDA, LINKÖPING UNIVERSITY, SWEDEN

1. INSTRUCTIONS

- **Deadline for individual and group reports**

See LISAM.

- **What and how to hand in**

Each student must send a report to LISAM with his/her solutions to the lab. The file should be named `FirstName.LastName.pdf`. The report must be concise but complete. It should include (i) the code implemented or the calls made to existing functions, (ii) the results of such code or calls, and (iii) explanations for (i) and (ii).

In addition, students must discuss their lab solutions in a group. Each group must compile a collaborative report that will be used for presentation at the seminar. The report should clearly state the names of the students that participated in its compilation and a short description of how each student contributed to the report. This report should be submitted via LISAM. The file should be named `Group_X.pdf` where `X` is the group number. Please, upload also a copy of the group report to the collaborative workspace folder in LISAM. The collaborative reports are corrected and graded. The individual reports are also checked, but feedback on them will not be given. A student passes the lab if the group report passes the seminar and the individual report has reasonable quality, otherwise the student must complete his/her individual report by correcting the mistakes in it.

Attendance to the seminar is obligatory. In the seminar, some groups will be responsible for presenting their group reports. Each student in these groups must be prepared to individually present an arbitrary part of the report. The selection of the speakers is done randomly during the seminar. In the seminar, some groups will act as opponents to the reports provided by the presenters. The opponent group should examine the group report of the presenter group before the seminar (available in the collaborative workspace folder in LISAM), and prepare a minimum of three questions, comments and/or improvements. The opponent group will ask these questions during the seminar. Check LISAM for the list of presenter and opponent groups.

2. QUESTIONS

The purpose of the lab is to put in practice some of the concepts covered in the lectures. To do so, you are asked to implement the particle filter for robot localization. For the particle filter algorithm, please check Section 13.3.4 of Bishop's book and/or the slides for the last lecture on state space models (SSMs). The robot moves along the horizontal axis according to the following SSM:

$$p(z_t|z_{t-1}) = \left(\mathcal{N}(z_t|z_{t-1}, 1) + \mathcal{N}(z_t|z_{t-1} + 1, 1) + \mathcal{N}(z_t|z_{t-1} + 2, 1) \right) / 3 \quad // \text{ Transition model}$$

$$p(x_t|z_t) = \left(\mathcal{N}(x_t|z_t, 1) + \mathcal{N}(x_t|z_t - 1, 1) + \mathcal{N}(x_t|z_t + 1, 1) \right) / 3 \quad // \text{ Emission model}$$

$$p(z_1) = \text{Uniform}(0, 100) \quad // \text{ Initial model}$$

- (1) Implement the SSM above. Simulate it for $T = 100$ time steps to obtain $z_{1:100}$ (i.e., states) and $x_{1:100}$ (i.e., observations). Use the observations (i.e., sensor readings) to identify the state (i.e., robot location) via particle filtering. Use 100 particles. Show the particles, the expected location and the true location for the first and last time steps, as well as for two intermediate time steps of your choice.
- (2) Repeat the exercise above replacing the standard deviation of the emission model with 5 and then with 50. Comment on how this affects the results.
- (3) Finally, show and explain what happens when the weights in the particle filter are always equal to 1, i.e. there is no correction.
