Dynamic Bayesian Networks: Definition

- To model **sequential data**, e.g. time series data.
- **Simplification**: Time is discretized in equal width intervals, i.e. $t = 0, 1, \ldots$
- Consider a finite set of discrete random variables $X^t = \{X_1^t, \ldots, X_n^t\}$ representing the state at time t of a system described by $V = \{X_1, \ldots, X_n\}$.
- A **dynamic Bayesian network** (DBN) is a BN over $X^{0:T} = \{X^0, \ldots, X^T\}$. Thus, it defines $p(X^{0:T})$.

$$
\begin{array}{ccccc}
X_1^0 \rightarrow X_1^1 & X_1^2 & X_1^3 \rightarrow X_1^4 \\
\downarrow \quad \uparrow \searrow \downarrow & & \downarrow \\
X_2^0 \rightarrow X_2^1 & X_2^2 \rightarrow X_2^3 & X_2^4 \\
\downarrow \quad \uparrow \searrow \uparrow & & \downarrow \\
X_3^0 \rightarrow X_3^1 & X_3^2 \rightarrow X_3^3 & X_3^4
\end{array}
$$

- **Assumption**: The system is Markovian, i.e. $X^{t+1} \perp_p X^{0:t-1} | X^t$.

$$
\begin{array}{ccccc}
X_1^0 \rightarrow X_1^1 & X_1^2 & X_1^3 \rightarrow X_1^4 \\
\downarrow \quad \uparrow \searrow \downarrow & & \downarrow \\
X_2^0 \rightarrow X_2^1 & X_2^2 \rightarrow X_2^3 & X_2^4 \\
\downarrow \quad \uparrow \searrow \uparrow & & \downarrow \\
X_3^0 \rightarrow X_3^1 & X_3^2 \rightarrow X_3^3 & X_3^4
\end{array}
$$

- **Assumption**: The system is stationary, i.e. $p(X^{t+1} | X^t) = p(X' | X)$.

$$
\begin{array}{ccccc}
X_1^0 \rightarrow X_1^1 \rightarrow X_1^2 \rightarrow X_1^3 \rightarrow X_1^4 \\
\downarrow \quad \uparrow \quad \uparrow \quad \uparrow \quad \uparrow \\
X_2^0 \quad X_2^1 \quad X_2^2 \quad X_2^3 \quad X_2^4 \\
\downarrow \quad \uparrow \quad \uparrow \quad \uparrow \quad \uparrow \\
X_3^0 \rightarrow X_3^1 \rightarrow X_3^2 \rightarrow X_3^3 \rightarrow X_3^4
\end{array}
$$

Dynamic Bayesian Networks

- Then, a DBN over $X^{0:T}$ can be defined as
  - a BN over X^0, and
 - a BN over $X^t \cup X^{t+1}$ where the nodes in X^t are parentless.

Initial model	Transition model
X_1^0	$X_1^t \rightarrow X_1^{t+1}$
$\downarrow$	$\uparrow$
X_2^0	$X_2^t \quad X_2^{t+1}$
$\downarrow$	$\uparrow$
X_3^0	$X_3^t \rightarrow X_3^{t+1}$
- The DBN defines

$$p(X^{0:T}) = p(X^0) \prod_{t=0}^{T} p(X^{t+1}|X^t) = [\prod_{i=1}^{n} p(X_i^0|pa_G(X_i^0))][\prod_{t=0}^{T} \prod_{i=1}^{n} p(X_i^{t+1}|pa_G(X_i^{t+1}))]$$

- DBN unrolled for $T = 4$.

$$
\begin{array}{ccccc}
X_1^0 \rightarrow & X_1^1 \rightarrow & X_1^2 \rightarrow & X_1^3 \rightarrow & X_1^4 \\
\downarrow & \uparrow & \uparrow & \uparrow & \uparrow \\
X_2^0 & X_2^1 & X_2^2 & X_2^3 & X_2^4 \\
\downarrow & \uparrow & \uparrow & \uparrow & \uparrow \\
X_3^0 \rightarrow & X_3^1 \rightarrow & X_3^2 \rightarrow & X_3^3 \rightarrow & X_3^4
\end{array}
$$

Hidden Markov Models: Definition

- To overcome the **Markovian limitation** of DBNs, while keeping sparsity.
- A **hidden Markov model** (HMM) over $\{Z^{0:T}, X^{0:T}\}$ where $X^{0:T}$ are **observed** and $Z^{0:T}$ are **unobserved** consists of
  - a DBN over $Z^{0:T}$, and
  - a BN over $Z^t \cup X^t$ where the nodes in Z^t are parentless.

| Initial model	Transition model	Emission model
U_1^0	$U_1^t \rightarrow U_1^{t+1}$	U_1^t
$\downarrow$	$\uparrow$	U_2^t
U_2^0	$U_2^t \quad U_2^{t+1}$	U_3^t
$\downarrow$	$\uparrow$	O_1^t
U_3^0	$U_3^t \rightarrow U_3^{t+1}$	O_2^t

- A HMM is a DBN that defines

$$p(Z^{0:T}, X^{0:T}) = p(Z^0) \prod_{t=1}^{T} p(Z^{t+1}|Z^t) \prod_{t=0}^{T} p(X^t|Z^t)$$

- HMM unrolled for $T = 4$.
Hidden Markov Models: Learning

- The structure is typically fixed to

$$Z^0 \rightarrow Z^1 \rightarrow Z^2 \rightarrow Z^3 \rightarrow Z^4$$
$$\downarrow \quad \downarrow \quad \downarrow \quad \downarrow \quad \downarrow$$
$$X^0 \quad X^1 \quad X^2 \quad X^3 \quad X^4$$

- Consider a sample with a single observation over $X^{0:T}$.
- Parameter learning: EM algorithm.
- Cardinality of Z^t ? BIC score to select among a set of plausible values.

Hidden Markov Models: Learning

- Recall that maximizing the log likelihood function over $x^{0:T}$ is inefficient (no closed form solution) and ineffective (multimodal).

- Consider instead maximizing its expectation

$$\mathrm{E}_{Z^{0:T}}\big[\log p(Z^{0:T}, x^{0:T})\big] = \sum_{z^{0:T}} p(z^{0:T}|x^{0:T}) \log p(z^{0:T}, x^{0:T})$$

$$= \sum_{z^{0:T}} p(z^{0:T}|x^{0:T})\big[\log \theta_{z^0} + \sum_{t=1}^{T} \log \theta_{z^{t+1}|z^t} + \sum_{t=1}^{T} \log \theta_{x^t|z^t}\big]$$

$$= \sum_{z^0} p(z^0|x^{0:T}) \log \theta_{z^0} + \sum_{t=1}^{T} \sum_{z^t} \sum_{z^{t+1}} p(z^t, z^{t+1}|x^{0:T}) \log \theta_{z^{t+1}|z^t} + \sum_{t=1}^{T} \sum_{z_t} p(z^t|x^{0:T}) \log \theta_{x^t|z^t}$$

- Then

  - $\theta_{z^0}^{ML} = \frac{p(z^0|x^{0:T})}{\sum_{z^0} p(z^0|x^{0:T})}$
  - $\theta_{z^{t+1}|z^t}^{ML} = \frac{\sum_{t=1}^{T} p(z^t, z^{t+1}|x^{0:T})}{\sum_{t=1}^{T} \sum_{z^{t+1}} p(z^t, z^{t+1}|x^{0:T})}$
  - $\theta_{x^t|z^t}^{ML} = \frac{\sum_{t=1}^{T} p(z^t|x^{0:T}) 1_{\{x^t \in x^{0:T}\}}}{\sum_{t=1}^{T} p(z^t|x^{0:T})}$

- Note that computing $p(Z^0|x^{0:T})$, $p(Z^t, Z^{t+1}|x^{0:T})$ and $p(Z^t|x^{0:T})$ requires inference: Forward-backward algorithm.

Hidden Markov Models: Forward-Backward Algorithm

$$
\begin{aligned}
p(Z^t|x^{0:T}) &= \frac{p(x^{0:T}|Z^t)p(Z^t)}{p(x^{0:T})} \\
&= \frac{p(x^{0:t}|Z^t)p(Z^t)p(x^{t+1:T}|Z^t)}{p(x^{0:T})} \text{ by } X^{0:t} \perp_p X^{t+1:T}|Z^t \\
&= \frac{p(x^{0:t},Z^t)p(x^{t+1:T}|Z^t)}{p(x^{0:T})} = \frac{\alpha(Z^t)\beta(Z^t)}{\sum_{z^t}\alpha(z^t)\beta(z^t)}
\end{aligned}
$$

$$
\begin{aligned}
p(Z^t, Z^{t+1}|x^{0:T}) &= \frac{p(x^{0:T}|Z^t, Z^{t+1})p(Z^t, Z^{t+1})}{p(x^{0:T})} \\
&= \frac{p(x^{0:t}|Z^t)p(x^{t+1}|Z^{t+1})p(x^{t+2:T}|Z^{t+1})p(Z^{t+1}|Z^t)p(Z^t)}{p(x^{0:T})}
\end{aligned}
$$

$$
\begin{aligned}
\text{by} \quad & X^{0:t} \perp_p X^{t+1:T}|Z^t \cup Z^{t+1} \\
& X^{0:t} \perp_p Z^{t+1}|Z^t \\
& X^{t+1:T} \perp_p Z^t|Z^{t+1} \\
& X^{t+1} \perp_p X^{t+2:T}|Z^{t+1}
\end{aligned}
$$

$$
= \frac{\alpha(Z^t)\beta(Z^{t+1})p(x^{t+1}|Z^{t+1})p(Z^{t+1}|Z^t)}{\sum_{z^t}\sum_{z^{t+1}}\alpha(z^t)\beta(z^{t+1})p(x^{t+1}|z^{t+1})p(z^{t+1}|z^t)}
$$

Hidden Markov Models: Forward-Backward Algorithm

$$
\begin{aligned}
\boldsymbol{\alpha(Z^t)} &= p(x^t|Z^t)p(Z^t)p(x^{0:t-1}|Z^t) \text{ by } X^{0:t-1} \perp_p X^t|Z^t \\
&= p(x^t|Z^t)p(x^{0:t-1}, Z^t) = p(x^t|Z^t)\sum_{z^{t-1}} p(x^{0:t-1}, Z^t|z^{t-1})p(z^{t-1}) \\
&= p(x^t|Z^t)\sum_{z^{t-1}} p(x^{0:t-1}|z^{t-1})p(Z^t|z^{t-1})p(z^{t-1}) \text{ by } X^{0:t-1} \perp_p Z^t|Z^{t-1} \\
&= p(x^t|Z^t)\sum_{z^{t-1}} p(x^{0:t-1}, z^{t-1})p(Z^t|z^{t-1}) = p(x^t|Z^t)\sum_{z^{t-1}} \boldsymbol{\alpha(z^{t-1})}p(Z^t|z^{t-1}) \\
\alpha(Z^0) &= p(x^0|Z^0)p(Z^0)
\end{aligned}
$$

$$
\begin{aligned}
\boldsymbol{\beta(Z^t)} &= \sum_{z^{t+1}} p(x^{t+1:T}, z^{t+1}|Z^t) = \sum_{z^{t+1}} p(x^{t+1:T}|z^{t+1}, Z^t)p(z^{t+1}|Z^t) \\
&= \sum_{z^{t+1}} p(x^{t+1:T}|z^{t+1})p(z^{t+1}|Z^t) \text{ by } X^{t+1:T} \perp_p Z^t|Z^{t+1} \\
&= \sum_{z^{t+1}} p(x^{t+2:T}|z^{t+1})p(x^{t+1}|z^{t+1})p(z^{t+1}|Z^t) \text{ by } X^{t+2:T} \perp_p X^{t+1}|Z^{t+1} \\
&= \sum_{z^{t+1}} \boldsymbol{\beta(z^{t+1})}p(x^{t+1}|z^{t+1})p(z^{t+1}|Z^t) \\
\beta(Z^T) &= 1 \text{ by } p(Z^T|x^{0:T}) = \frac{\alpha(Z^T)\beta(Z^T)}{p(x^{0:T})} = p(Z^T|x^{0:T})\beta(Z^T)
\end{aligned}
$$

Hidden Markov Models: Forward-Backward Algorithm

FB algorithm

$\alpha(Z^0) := p(x^0|Z^0)p(Z^0)$
For $t = 1, \ldots, T$ do
$\quad \alpha(Z^t) := p(x^t|Z^t) \sum_{z^{t-1}} \alpha(z^{t-1})p(Z^t|z^{t-1})$
$\beta(Z^T) := 1$
For $t = T, \ldots, 0$ do
$\quad \beta(Z^t) := \sum_{z^{t+1}} \beta(z^{t+1})p(x^{t+1}|z^{t+1})p(z^{t+1}|Z^t)$
Return $\alpha(Z^0), \ldots, \alpha(Z^T), \beta(Z^0), \ldots, \beta(Z^T)$

‣ Unlike the LS algorithm, the FB algorithms consists of two independent steps.

‣ **Filtering**: $p(Z^t|x^{0:t}) = \frac{\alpha(Z^t)}{\sum_{z^t} \alpha(z^t)}$.

‣ **Smoothing**: $p(Z^t|x^{0:T}) = \frac{\alpha(Z^t)\beta(Z^t)}{\sum_{z^t} \alpha(z^t)\beta(z^t)}$.

Hidden Markov Models: Viterbi Algorithm

- ‣ To compute the most probable configuration for HMMs.

Viterbi algorithm

$\omega(Z^0) := \log p(Z^0) + \log p(x^0|Z^0)$

For $t = 0, \ldots, T$ do

$\quad \omega(Z^{t+1}) := \log p(x^{t+1}|Z^{t+1}) + \max_{z^t}[\log p(z^{t+1}|z^t) + \omega(z^t)]$

$\quad \psi(Z^{t+1}) := \arg\max_{z^t}[\log p(z^{t+1}|z^t) + \omega(z^t)]$

For $t = T, \ldots, 0$ do

$\quad u_{\max}^t := \psi(u_{\max}^{t+1})$

Return $u_{\max}^{0:T}$

- ‣ **Exercise**. Prove that the Viterbi algorithm is correct.
